## Collapsing Data

For many of the indicators in this report, only “yes” responses are analyzed and reported for state to state comparisons and significance testing. However, there are several indicators for which the “yes” response was collapsed with the middle response (for example, a “sometimes” response, or a “some input” response) to form the “yes” indicator category which was then analyzed and subsequently reported. For example, for choice indicators, responses “person chose” and “person had some input” were collapsed into one “yes, person chose” category. For those indicators, the two responses were considered to be equally indicative of a positive outcome.

The tables below describe the variables and response options used to recode and collapse data included in this report. Tables are separated by NCI-IDD Domain.

**Please note**, an expanded guide for variable reporting (including information on how data are filtered) is available upon request through HSRI. Please email Dorothy at [dhiersteiner@hsri.org](mailto:dhiersteiner@hsri.org) for more info.
