

National Core Indicators[®] - Intellectual and Developmental Disabilities (NCI[®]-IDD)

National Report 2024-25

**NCI-IDD In-Person Survey
Measures**

**Included in the
HCBS Quality Measure Set**

Introduction

What is this chapter?

In May of 2024, the Centers for Medicare & Medicaid Services (CMS) released the final Ensuring Access to Medicaid Services rule (Access Rule). The rule includes new requirements related to the direct care workforce, access to home and community-based services (HCBS), health and safety protections, quality measures, and more.

The Access Rule aims to strengthen the HCBS that make it possible for people to live in the community in ways that are meaningful to them.

As part of the Access Rule, states will be required to report on a set of national standardized quality measures specifically for HCBS. This HCBS Quality Measure Set includes several measures from NCI-IDD In Person Survey (IPS).

This chapter demonstrates the data from the 2024-25 NCI-IDD IPS measures included in the HCBS Quality Measure set. The data shown here are identical to those data shown in the 2024-25 NCI-IDD IPS National Report.

IMPORTANT: The data included in this chapter include people who do not receive HCBS.

When future data are reported to CMS for purposes of the HCBS Quality Measure Set, the data will only include those receiving HCBS.

Where do these data come from?

Where indicated, some items in this chapter are drawn from administrative sources. Select items may have been collected during the face-to-face survey from the person receiving services, or for some select questions, from a “proxy” respondent. A proxy respondent is someone who knows the person well (e.g., a family member), proxy respondents may not be a case manager/service coordinator. Items that may come from administrative records or allow for proxy respondents are noted in the table title. Read more about why we allow proxy respondents for select questions in the IPS in the Overview chapter of this report. Read more about NCI-IDD domains and sub-domains in the Overview chapter of this report.

What are “collapsed” data?

Many questions in the IPS allow respondents to answer a question with “middle” response like “maybe”, “sometimes” or “in-between”. The tables in this section present collapsed data. That means that two or more response options are grouped together if they are considered to reflect a positive outcome. To see the breakout of responses for each option, please see Appendix C.

What is weighting and why do we do it?

The NCI-IDD averages are “weighted” to reflect the states’ relative population and sample sizes. We created the weights using the state’s number of valid surveys and its total survey-eligible population. This way, a state that provides services to a larger number of people but uses a sample similar in size to other states has a greater influence on the overall NCI-IDD average (that is, its contribution is *proportional to its service population*). You can read more about this in the Methodology section of the Overview chapter. The number of respondents (N) for each question *is not* weighted.

Presentation of state and weighted NCI-IDD averages

Averages

For the most part, the state outcomes are shown in descending order of percentage and are categorized as statistically significantly above the NCI-IDD Average, within the range of the NCI-IDD Average, or significantly below the NCI-IDD Average. Statistical significance is taken to be at or below the .01 level. For those states that fall within the NCI-IDD Average range, their ‘always’ or ‘yes’ response was not statistically different from the NCI-IDD Average. Other tables show the states listed in alphabetical order and are not tested for significance.

Tables that show significance also break out average results for each state by the type of residence: ICF/IID or other institutional settings, group residence, own home, parent/relative’s home, foster or host home. Figure A on the following page shows, by state, the percentage of people surveyed in each residence type. Please note though that:

- Significance testing was not performed on the breakouts by residence
- The number of people in each residential setting is often too small to allow for valid state-to-state comparisons
- And in many cases, statistically valid conclusions cannot be drawn about differences in results between residence types

Still, we provide this information for states’ internal purposes. It should not be used to compare one state with another.

To protect people’s privacy, we do not show the data when 20 or fewer people from a state or residence type responded to a question (though their responses are included in the NCI-IDD average).

States with more than 25% missing or don’t know responses are marked with an asterisk (*).

Additional Table Notes

Table 7: Risk adjusted. For more information on risk adjustment, see the Overview and Methodology chapter.

Table 9: The scale includes the following items: Person is satisfied with how often they went on shopping in the past month; Person is satisfied with how often they went out for entertainment in the past month; Person is satisfied with how often they went to a restaurant or coffee shop in the past month; Person is satisfied with how often they went to a religious service or spiritual practice in the past month; Person is satisfied with the level of community group participation.

NCI-IDD CI-3: Transportation Availability Scale

(The Proportion of People Who Report Adequate Transportation)

Table 2. Adequate Transportation Scale

The scale scores are calculated using data from two variables: having access to transportation when wanted and having access to transportation when needed.
